Healthcare-Associated Infections in North Carolina

Reporting Period: January 1 – September 30, 2014

Healthcare Consumer Version
N.C. Department of Health and Human Services

N.C. Healthcare-Associated Infections Prevention Program
N.C. Communicable Disease Branch
**Introduction**

The prevention of healthcare-associated infections is a public health priority in North Carolina and is a collaborative effort among the healthcare and public health communities. This January 2015 Healthcare-Associated Infections report is an important product of this collaboration. Included in this report is information about infections occurring in North Carolina short-term acute care hospitals, long-term acute care hospitals, and inpatient rehabilitation facilities from January 1 through September 30, 2014. Data included in this report are preliminary and therefore subject to change.

This report focuses on five important types of healthcare-associated infections that may occur while patients are hospitalized: central line-associated bloodstream infections, catheter-associated urinary tract infections, and surgical site infections (specifically those following abdominal hysterectomies or colon surgeries), MRSA laboratory-identified infections (MRSA LabID), and *Clostridium difficile* laboratory-identified infections (C. difficile or CDI LabID). These infections account for a large proportion of infections and deaths attributed to healthcare, but they do not represent the full spectrum of healthcare-associated infections.

This report was prepared by the North Carolina Healthcare-Associated Infections Prevention Program located in the Communicable Disease Branch of the Epidemiology Section of the North Carolina Division of Public Health. The NC Healthcare-Associated Infections Prevention Program works to eliminate preventable infections in health care settings by:

1. Conducting statewide surveillance for selected healthcare-associated infections;
2. Providing useful, unbiased information to health care providers and consumers;
3. Promoting and coordinating prevention efforts; and
4. Responding to outbreaks in health care settings.

We hope that the information in this report will be useful to healthcare consumers. Data are intended to provide an understanding of the burden of healthcare-associated infections in North Carolina and an opportunity to evaluate infection rates across the state. Prevention tips are also provided so readers can take steps to minimize their risk of acquiring a healthcare-associated infection (Appendix C). A separate, more technical healthcare provider version of this report is also available at [http://epi.publichealth.nc.gov/cd/hai/figures.html](http://epi.publichealth.nc.gov/cd/hai/figures.html). We welcome your feedback to improve the usefulness of future reports ([nchai@dhhs.nc.gov](mailto:nchai@dhhs.nc.gov)).

Acknowledgements

The North Carolina Healthcare-Associated Infections Prevention Program would like to acknowledge and thank hospital infection preventionists across the state, who work tirelessly to protect patients from infection. These preventionists provided the data used to create this report and worked with their hospital colleagues to identify and reconcile any potential problems with the data. This acknowledgement and gratitude extends to the hospital. While reporting of healthcare-associated infections is required, their support for healthcare-associated infections reporting and efforts to assure accurate reporting of infections is appreciated. The recent successes in fighting healthcare-associated infections would not have been possible without the continuing efforts, dedication and collaboration of hospitals and hospital infection preventionists.

The Healthcare-Associated Infections Prevention Program would also like to recognize the contributions of the Healthcare-Associated Infections Advisory Group members listed in Appendix D. In particular, the program is grateful to the Subgroup on Reporting and Surveillance for their thoughtful feedback on the presentation and content of these quarterly reports.

Finally, the program would like to acknowledge our partners, who have been important leaders and strong supporters of surveillance and prevention programs for healthcare-associated infections in North Carolina. These include the North Carolina Hospital Association, the North Carolina Statewide Program for Infection Control and Epidemiology, the North Carolina Chapter of the Association for Professionals in Infection Control and Epidemiology, the Carolinas Center for Medical Excellence, and the Adult Care Licensure and Nursing Home Licensure and Certification sections of the North Carolina Division of Health Service Regulation.

I. Surveillance for Healthcare-Associated Infections in North Carolina

Healthcare-associated infections (HAIs) are infections caused by a variety of organisms – including bacteria, viruses and fungi – while receiving medical care. As part of the effort to reduce such types of infections, hospitals report specific types of HAIs to the NC Division of Public Health (DPH) as required by law (General Statute 130A-150). Since 2012, they have been reporting central line-associated bloodstream infections (CLABSI), catheter-associated urinary tract infections (CAUTI), and surgical site infections (SSI) occurring after inpatient abdominal hysterectomies or colon surgeries. Beginning in January 2013, short-term acute care hospitals began reporting of laboratory-confirmed (LabID) bloodstream infections caused by methicillin-resistant *Staphylococcus aureus* (MRSA) and infections caused by *Clostridium difficile* (C. diff).

By North Carolina law, hospital reporting requirements are based on the reporting requirements established by the Centers for Medicare and Medicaid Services (CMS).

HAI information is entered into the CDC web-based surveillance system called the National Healthcare Safety Network (NHSN). The N.C. HAI Program works with hospitals on a monthly basis to ensure their data are accurate and timely. All data in NHSN are entered and modified by hospitals; the N.C. HAI Program cannot enter or change data in NHSN.

To learn more about CLABSIs, CAUTIs, SSIs, MRSA, *Clostridium difficile* and other HAIs, please visit the N.C. Healthcare-Associated Infections website at [http://epi.publichealth.nc.gov/cd/diseases/hai.html](http://epi.publichealth.nc.gov/cd/diseases/hai.html). In addition to information about specific infections, there is a link to the “Facts and Figures” webpage ([http://epi.publichealth.nc.gov/cd/hai/figures.html](http://epi.publichealth.nc.gov/cd/hai/figures.html)), which includes current and previous reports. The Healthcare-Associated Infection in North Carolina - Reference Report issued in October 2012 and revised in July 2013, contains background information on HAIs, HAI surveillance in North Carolina, and detailed information on statistics commonly used to describe and summarize HAIs. Subsequent reports, published quarterly, cover timely state-level and facility-specific data on the incidence of healthcare associated infections in hospitals across the state, as well as information on the creation and progress of various initiatives to reduce HAIs.

According to NC Administrative Code rules (10A North Carolina Administrative Code 41A .0106), North Carolina hospitals are required to report the healthcare-associated infections listed in the CMS-IPPS Rule.1 A list of these conditions and the starting dates for reporting are included in Table 1. Requirements beginning January 2015 will be reflected in the upcoming July 2015 Quarterly Report which will publish Jan-Mar 2015 data.

*Long-Term Care Hospitals are called Long-Term Acute Care Hospitals in the National Healthcare Safety Network.*
II. Hospital-Specific Summary Reports

A. Explanation of the Hospital-Specific Summary Reports

Each hospital-specific summary report contains up to seven sections: 1) general hospital information, 2) central line-associated bloodstream infections (CLABSI), 3) catheter associated urinary tract infections (CAUTI), 4) surgical site infections (SSI) after abdominal hysterectomies and colon surgeries, 5) MRSA laboratory-identified events (MRSA LabID), 6) *C. difficile* laboratory-identified events (CDI LabID) and 7) commentary from the hospital. These sections are described below.

These reports cover the first six months of 2014 and data were downloaded from NHSN on September 25, 2014; any changes made to the data after this date are not reflected in this report.

Before reviewing this report, a few clarifications about the data need to be made:

1. **The data within this report are preliminary.** Although efforts were made by hospitals and the N.C. HAI Program to ensure that the data were accurate and complete, the data are self-reported and have not been formally “double checked”, or validated. Until data validation is completed, numbers should be interpreted with caution.

2. **There may be differences in reporting practices among hospitals.** Hospitals with more infection control personnel and resources may be able to identify and report more infections compared to a hospital with fewer infection control resources.

3. **There may be differences between results published by the N.C. HAI Program and results published elsewhere** (i.e., CMS, Centers for Medicare and Medicaid Services). Results may differ due to using data from different time periods, different facility types, different patient populations, and/or different methods of analysis.

4. **The N.C. HAI Program chose not to present some rates** for individual hospital units, procedures or hospitals that did not meet a threshold (minimum value) for the reporting period. The minimum threshold numbers are based on CDC recommendations for reporting healthcare-associated infection data:
   - Central line-associated bloodstream infections: 50 central line days;
   - Catheter-associated urinary tract infections: 50 catheter days; and
   - Surgical site infections: 20 surgeries.

5. **Laboratory-Identified Events (LabID):** Methicillin-resistant *Staphylococcus aureus* (MRSA) bacteremia (blood infection) and *Clostridium difficile* infections (CDI) LabID events rely on laboratory data. Patients did not have to be ill to have a positive result, and a positive result can be determined without requiring clinical information about the patient. This allows for a much less labor-intensive means to track CDI and MRSA infections. Only those LabID events that are acquired in the hospital are displayed in this report.
1. General Hospital Information

This section contains general information about the hospital and includes a map of where the hospital (blue “H” icon) is located in North Carolina. Data in this section are from the NSHN 2013 Annual Hospital Survey.

2. HAI Information

All HAIs include reporting from short-term acute care hospitals (i.e., CLABSI, CAUTI, SSI, MRSA LabID, CDI LabID). Long-term acute care hospitals report CLABSI and CAUTI HAIs, while inpatient rehabilitation facilities report only CAUTIs. Specialty hospitals also report MRSA and CDI LabID events. A list of reporting hospitals by facility category can be found in Appendix E.

There may be more than one reporting unit for a given facility HAI (specifically for CLABSI and CAUTI), such as multiple intensive care units, but the hospital-specific report tables only summarize the year-to-date total across all reporting units in the hospital.

a. Report Tables: All HAI tables include: 1) the total number of infections during the reporting period; 2) the total number of days at risk for infection (e.g., central line days for CLABSI, catheter days for CAUTI, the number of procedures for SSI, and the number of patient days for MRSA and CDI LabID); 3) the infection rate, and 4) the bar graph interpretation. The infection rate and bar graph interpretation are described below.

Table 2a. – Example of Hospital-Specific Report Table

![Central Line-Associated Bloodstream Infections (CLABSI)](image)

b. Rates: Each HAI rate was calculated and reported as follows:

- **CLABSI Rate** = (number of infections/number of central line days) x 1,000*; Reported per 1,000 central line days
- **CAUTI Rate** = (number of infections/number of catheter days) x 1,000*; Reported per 1,000 catheter days
- **SSI Rate** = (number of infections/number of procedures) x 100*; Reported per 100 procedures (abdominal hysterectomies or colon surgeries)
- **MRSA Rate** = (number of positive laboratory events/number of patient days) x 1,000; Reported per 1,000 patient days
- **CDI Rate** = (number of positive laboratory events/number of patient days) x 10,000; Reported per 10,000 patient days

**NOTE:** Not all HAI rates are provided in the report. If the hospital reports <50 central line days for CLABSI, <50 catheter days for CAUTI, or <20 procedures for SSI (abdominal hysterectomies or colon surgeries) then rates and additional statistics were not calculated; the rate is indicated as blank or “.” in the HAI table, per Table 2b.

Table 2b. – Example of Rate Calculation Not Done

![Surgical Site Infections (SSI)](image)
c. **Bar Graph Interpretations:** These interpretations in the HAI tables are the result of statistical tests or comparisons used to determine if there is a difference between the hospital’s infection rate (number of infections/number of days at risk for infection) and 1) the rate of similarly-sized hospitals (i.e., Hosp Grp.) and 2) the rate of N.C. hospitals overall (i.e., NC). Interpretations indicate that the hospital rate was lower, not different, or higher compared to the rate of similarly-sized hospitals or N.C. hospitals overall. Interpretations of the bar graphs are explained further in Table 2d.

**NOTE:** HAI rate comparisons were not made if the hospital rate was blank ("."), or if the hospital rate was 0.

**Table 2c. – Example of Bar Graph Interpretations**

![Bar Graph Interpretations: A comparison to similarly-sized hospitals was not conducted. A comparison to NC hospitals overall was not conducted.](image)

3. **Commentary from Hospital**
   This section includes hospital comments on their HAI data and current infection control activities. Hospitals can provide a link to their hospital website to provide lengthier comments.

**Statistics**
For a detailed explanation of statistics included in the HAI reports, see the NC DHHS HAI in NC report issued October 2012 and revised July 2013 ([http://epi.publichealth.nc.gov/cd/hai/figures.html](http://epi.publichealth.nc.gov/cd/hai/figures.html)). Explanations on concepts such as statistical significance and computation of measures including rates and standardized infection ratios (SIRs) are provided.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under "quality" on NovantHealth.org.

N.C. Division of Public Health, HAI Prevention Program

N.C. HAI Quarterly Report (Consumer Version) - January 2015
The prevention and reduction of healthcare associated infections is a top priority at Carolinas Healthcare System hospitals. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Commentary from Hospitals:
The prevention and reduction of healthcare associated infections is a top priority at Cleveland County Healthcare System hospitals. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

N.C. Division of Public Health, HAI Prevention Program
N.C. HAI Quarterly Report (Consumer Version) - January 2015
The document provides information on Crawley Memorial Hospital in Shelby, Cleveland County, which is a Long-term Acute Care Hospital. It is a Not-for-Profit hospital with the following statistics:

- Admissions in 2013: 120
- Patient Days in 2013: 2,996
- Total Number of Beds: 41
- FTE* Infection Preventionists: 0.25
- Number of FTEs* per 100 beds: 0.61

The document also includes tables and graphs comparing the hospital to North Carolina long-term acute care hospitals:

### Central Line-Associated Bloodstream Infections (CLABSI)

Commentary from Hospitals:
Over the past year, FirstHealth has strived to continue to reduce our infections by continuing to educate staff on infection prevention, emphasizing hand hygiene, and following all evidence based practices to reduce infections. We have worked to decrease use of urinary catheters and worked with our operating room to assure all measures are taken to prevent surgical site infections such as appropriate use of antibiotics. We are also participating in the Partnership for Patients Collaborative with the North Carolina Quality Center.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under “quality” on NovantHealth.org.

Figure 6. Rates and 95% Confidence Intervals for Colon Surgeries, Jan-Sep 2014.

Commentary from Hospitals:
FRMC has zero central line blood stream infections. We implemented an alcohol impregnated port protector that guards against infection by keeping the needleless valves of central lines protected and clean. Foley catheter related urinary tract infection is a challenge and we continue to work on removing the catheter when not necessary. Our commitment to the prevention of infections is a goal we take very seriously. Our commitment to our community to make certain our processes and policies are in line with achieving zero infections.

N.C. Division of Public Health, HAI Prevention Program

N.C. HAI Quarterly Report (Consumer Version) - January 2015
The prevention and reduction of healthcare associated infections is a top priority at Haywood Regional Medical Center. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

N.C. Division of Public Health, HAI Prevention Program  
N.C. HAI Quarterly Report (Consumer Version) - January 2015
The prevention and reduction of healthcare associated infections is a top priority at Cleveland County Healthcare System hospitals. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Data as of January 5, 2015.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under "quality" on NovantHealth.org.

Refer to the HAI in NC Reference Report - October 2012 (rev June 2013) for further explanation of presented statistics (epi.publichealth.nc.gov/cd/hai/figures.html).

### Commentary from Hospitals:

Mission Health strives to improve the quality and safety of the care we give our patients each and every day. The prevention of infections is one of our highest priorities. By continuously and thoughtfully reviewing processes, procedures and events, we identify opportunities for improvement and address them immediately and appropriately, and share that knowledge internally to avert further issues.

Commentary from Hospitals:
At New Hanover Regional Medical Center we take patient safety and quality care extremely seriously. We implement the latest science-based protocols to prevent hospital-acquired infection. We study and adopt best practices, evidence-based medicine and recommendations from national agencies to deliver the best possible outcomes for our patients. We encourage patients and their families to take an active role in helping prevent infections. Our team of infection preventionists works with all staff to ensure they are focused on delivering the highest quality of care possible. We are proud of our success and our ongoing quest to keep preventable infections to an absolute minimum.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under “quality” on NovantHealth.org.

Infections from deep incisional and/or organ space.
Note: Rate per 100 inpatient surgeries. Rate not calculated if less than 20 inpatient surgeries.

Bar Graph Interpretations:
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under "quality" on NovantHealth.org.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under “quality” on NovantHealth.org.

Figure 6. Rates and 95% Confidence Intervals for Colon Surgeries, Jan-Sep 2014.

Commentary from Hospitals:
UNC Health Care is pleased that our rates of all reported healthcare-associated infections are statistically similar to similarly-sized hospitals despite care in a tertiary referral hospital for highly vulnerable populations (e.g., organ transplant, HIV infected, cancer, severely burned, and very premature infants). NC residents should be aware that the reported information is NOT corrected for the severity of illness of the hospital’s patients. UNC Health Care supports the need for the data presented in this report to be validated (i.e., demonstration by independent monitors that the submitted data is correct).

N.C. Division of Public Health, HAI Prevention Program
N.C. HAI Quarterly Report (Consumer Version) - January 2015
Wake Forest Baptist Health continually strives to provide a safe environment for patients, their families, and our community. In response to the C. difficile rate (CDI LabID), Wake Forest Baptist Health is reinforcing appropriate infection prevention measures (e.g., proper hand hygiene, environmental cleaning, and appropriate isolation of patients), and has launched several comprehensive pilot programs in high-risk patients (e.g., medical ICU) to address this issue.

Data as of January 5, 2015.

191
The prevention and reduction of healthcare associated infections is a top priority at Wilkes Regional Medical Center. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Commentary from Hospitals:
In 2013, Wilson Medical Center changed the laboratory method for testing C. difficile to a more sensitive molecular test. As expected, the increase in sensitivity of this test resulted in more positive C. difficile reported in 2013. Not all hospitals have converted to this advanced testing method.

| Beds                                      | The number of staffed beds in a facility or patient care location. This may be different from licensed beds.                                |
| Catheter days                             | A daily count of the number of patients with an indwelling urinary catheter. For example, one patient with an indwelling catheter in place for two days or two patients with indwelling catheters in place for one day each would both result in two catheter days. This number is used when presenting rates of catheter-associated urinary tract infections. |
| Catheter-associated urinary tract infection | Urinary tract infection (UTI) that occurs in a patient who had an indwelling urinary catheter in place within the 48-hour period before the onset of the UTI. |
| Central line                              | A catheter (tube) that doctors place in a large vein in the neck, chest, or groin that ends near the heart. It is used to give medication or fluids or to collect blood for medical tests. Also known as a central venous catheter. |
| Central line-associated bloodstream infection | A bloodstream infection (BSI) that occurs in a patient who had a central line within the 48-hour period before the onset of the BSI and is not related to an infection at another site. |
| Central line days                         | A daily count of the number of patients with a central line. For example, one patient with a central line in place for two days or two patients with central lines in place for one day each would both result in two central line days. This number is used when presenting rates of central line-associated bloodstream infections. |
| Device days                               | A daily count of the number of patients with a specific device (e.g., central line, umbilical catheter, ventilator, or urinary catheter) in the patient care location. For example, one patient with a device in place for two days or two patients with devices in place for one day each would both result in two device days. This number is used when presenting rates of infections associated with devices. |
| Full-time equivalent                      | The equivalent of one person working full time for one year: 8 hour per day at 5 days per week for 52 weeks per year = 2080 hours per year |
| Hand hygiene                              | A general term that applies to routine hand washing, antiseptic hand wash, antiseptic hand rub, or surgical hand antisepsis. |
|                                          | Routine hand washing is the use of clean water and non-antimicrobial soap to remove germs, soil and other debris from the hands. |
|                                          | Antisepctic hand washing is the use of water and antimicrobial soap to remove or kill germs on the hands. |
| Hand hygiene (cont)                       | Antisepctic hand rub is the use of alcohol-based hand rubs to remove or destroy susceptible

What is a catheter-associated bloodstream infection?

A “central line” or “central catheter” is a tube that is placed into a patient’s large vein, usually in the neck, chest, arm, or groin. The catheter is often used to draw blood, or give fluids or medications. It may be left in place for several weeks. A bloodstream infection can occur when bacteria or other germs travel down a “central line” and enter the blood. If you develop a catheter-associated bloodstream infection you may become ill with fevers and chills or the skin around the catheter may become sore and red.

Can a catheter-related bloodstream infection be treated?

A catheter-associated bloodstream infection is serious, but often can be successfully treated with antibiotics. The catheter might need to be removed if you develop an infection.

What are some of the things that hospitals are doing to prevent catheter-associated bloodstream infections?

To prevent catheter-associated bloodstream infections doctors and nurses will:

• Choose a vein where the catheter can be safely inserted and where the risk for infection is small.

• Clean their hands with soap and water or an alcohol-based hand rub before putting in the catheter.

• Wear a mask, cap, sterile gown, and sterile gloves when putting in the catheter to keep it sterile. The patient will be covered with a sterile sheet.

• Clean the patient’s skin with an antiseptic cleanser before putting in the catheter.

• Clean their hands, wear gloves, and clean the catheter opening with an antiseptic solution before using the catheter to draw blood or give medications. Healthcare providers also clean their hands and wear gloves when changing the bandage that covers the area where the catheter enters the skin.

• Decide every day if the patient still needs to have the catheter. The catheter will be removed as soon as it is no longer needed.

• Carefully handle medications and fluids that are given through the catheter.

What can I do to help prevent a catheter-associated bloodstream infection?

• Ask your doctors and nurses if they will be using all of the prevention methods discussed above.

• Make sure that all doctors and nurses caring for you clean their hands with soap and water or an alcohol-based hand rub before and after caring for you.

If you do not see your providers clean their hands, please ask them to do so.

• If the bandage comes off or becomes wet or dirty, tell your nurse or doctor immediately.

• Inform your nurse or doctor if the area around your catheter is sore or red.

• Do not let family and friends who visit touch the catheter or the tubing.

• Make sure family and friends clean their hands with soap and water or an alcohol-based hand rub before and after visiting you.

What do I need to do when I go home from the hospital?

Some patients are sent home from the hospital with a catheter in order to continue their treatment. If you go home with a catheter, your doctors and nurses will explain everything you need to know about taking care of your catheter.

• Make sure you understand how to care for the catheter before leaving the hospital. For example, ask for instructions on showering or bathing with the catheter and how to change the catheter dressing.

• Make sure you know who to contact if you have questions or problems after you get home.

• Make sure you wash your hands with soap and water or an alcohol-based hand rub before handling your catheter.

• Watch for the signs and symptoms of catheter-associated bloodstream infection, such as soreness or redness at the catheter site or fever, and call your healthcare provider immediately if any occur.

If you have additional questions, please ask your doctor or nurse.
What is "catheter-associated urinary tract infection"? A urinary tract infection (also called "UTI") is an infection in the urinary system, which includes the bladder (which stores the urine) and the kidneys (which filter the blood to make urine). Germs (for example, bacteria or yeasts) do not normally live in these areas; but if germs are introduced, an infection can occur.

If you have a urinary catheter, germs can travel along the catheter and cause an infection in your bladder or your kidney; in that case it is called a catheter-associated urinary tract infection (or "CA-UTI").

What is a urinary catheter? A urinary catheter is a thin tube placed in the bladder to drain urine. Urine drains through the tube into a bag that collects the urine. A urinary catheter may be used:
- If you are not able to urinate on your own
- To measure the amount of urine that you make, for example, during intensive care
- During and after some types of surgery
- During some tests of the kidneys and bladder

People with urinary catheters have a much higher chance of getting a urinary tract infection than people who don't have a catheter.

How do I get a catheter-associated urinary tract infection (CA-UTI)? If germs enter the urinary tract, they may cause an infection. Many of the germs that cause a catheter-associated urinary tract infection are common germs found in your intestines that do not usually cause an infection there. Germs can enter the urinary tract when the catheter is being put in or while the catheter remains in the bladder.

What are the symptoms of a urinary tract infection? Some of the common symptoms of a urinary tract infection are:
- Burning or pain in the lower abdomen (that is, below the stomach)
- Fever
- Bloody urine may be a sign of infection, but is also caused by other problems
- Burning during urination or an increase in the frequency of urination after the catheter is removed.

Sometimes people with catheter-associated urinary tract infections do not have these symptoms of infection.

Can catheter-associated urinary tract infections be treated? Yes, most catheter-associated urinary tract infections can be treated with antibiotics and removal or change of the catheter. Your doctor will determine which antibiotic is best for you.

What are some of the things that hospitals are doing to prevent catheter-associated urinary tract infections? To prevent urinary tract infections, doctors and nurses take the following actions.

Catheter insertion
- Catheters are put in only when necessary and they are removed as soon as possible.
- Only properly trained persons insert catheters using sterile ("clean") technique.
- The skin in the area where the catheter will be inserted is cleaned before inserting the catheter.
- Other methods to drain the urine are sometimes used, such as:
  - External catheters in men (these look like condoms and are placed over the penis rather than into the penis)
  - Putting a temporary catheter in to drain the urine and removing it right away. This is called intermittent urethral catheterization.

Catheter care
- Healthcare providers clean their hands by washing them with soap and water or using an alcohol-based hand rub before and after touching your catheter.
  - If you do not see your providers clean their hands, please ask them to do so.
- Avoid disconnecting the catheter and drain tube. This helps to prevent germs from getting into the catheter tube.
- The catheter is secured to the leg to prevent pulling on the catheter.
- Avoid twisting or kinking the catheter.
- Keep the bag lower than the bladder to prevent urine from backflowing to the bladder.
- Empty the bag regularly. The drainage spout should not touch anything while emptying the bag.

What can I do to help prevent catheter-associated urinary tract infections if I have a catheter?
- Always clean your hands before and after doing catheter care.
- Always keep your urine bag below the level of your bladder.
- Do not tug or pull on the tubing.
- Do not twist or kink the catheter tubing.
- Ask your healthcare provider each day if you still need the catheter.

What do I need to do when I go home from the hospital?
- If you will be going home with a catheter, your doctor or nurse should explain everything you need to know about taking care of the catheter. Make sure you understand how to care for it before you leave the hospital.
- If you develop any of the symptoms of a urinary tract infection, such as burning or pain in the lower abdomen, fever, or an increase in the frequency of urination, contact your doctor or nurse immediately.
- Before you go home, make sure you know who to contact if you have questions or problems after you get home.

If you have questions, please ask your doctor or nurse.
What is a Surgical Site Infection (SSI)?
A surgical site infection is an infection that occurs after surgery in the part of the body where the surgery took place. Most patients who have surgery do not develop an infection. However, infections develop in about 1 to 3 out of every 100 patients who have surgery.

Some of the common symptoms of a surgical site infection are:
- Redness and pain around the area where you had surgery
- Drainage of cloudy fluid from your surgical wound
- Fever

Can SSIs be treated?
Yes. Most surgical site infections can be treated with antibiotics. The antibiotic given to you depends on the bacteria (germs) causing the infection. Sometimes patients with SSIs also need another surgery to treat the infection.

What are some of the things that hospitals are doing to prevent SSIs?
To prevent SSIs, doctors, nurses, and other healthcare providers:
- Clean their hands and arms up to their elbows with an antiseptic agent just before the surgery.
- Clean their hands with soap and water or an alcohol-based hand rub before and after caring for each patient.
- May remove some of your hair immediately before your surgery using electric clippers if the hair is in the same area where the procedure will occur. They should not shave you with a razor.
- Wear special hair covers, masks, gowns, and gloves during surgery to keep the surgery area clean.
- Give you antibiotics before your surgery starts. In most cases, you should get antibiotics within 60 minutes before the surgery starts and the antibiotics should be stopped within 24 hours after surgery.
- Clean the skin at the site of your surgery with a special soap that kills germs.

What can I do to help prevent SSIs?

Before your surgery:
- Tell your doctor about other medical problems you may have. Health problems such as allergies, diabetes, and obesity could affect your surgery and your treatment.
- Quit smoking. Patients who smoke get more infections. Talk to your doctor about how you can quit before your surgery.
- Do not shave near where you will have surgery. Shaving with a razor can irritate your skin and make it easier to develop an infection.

At the time of your surgery:
- Speak up if someone tries to shave you with a razor before surgery. Ask why you need to be shaved and talk with your surgeon if you have any concerns.
- Ask if you will get antibiotics before surgery.

After your surgery:
- Make sure that your healthcare providers clean their hands before examining you, either with soap and water or an alcohol-based hand rub.
- Family and friends who visit you should not touch the surgical wound or dressings.
- Family and friends should clean their hands with soap and water or an alcohol-based hand rub before and after visiting you. If you do not see them clean their hands, ask them to clean their hands.

What do I need to do when I go home from the hospital?
- Before you go home, your doctor or nurse should explain everything you need to know about taking care of your wound. Make sure you understand how to care for your wound before you leave the hospital.
- Always clean your hands before and after caring for your wound.
- Before you go home, make sure you know who to contact if you have questions or problems after you get home.
- If you have any symptoms of an infection, such as redness and pain at the surgery site, drainage, or fever, call your doctor immediately.

If you have additional questions, please ask your doctor or nurse.

What is MRSA?

*Staphylococcus aureus* (pronounced staff-ill-oh-KOK-us AW-ree-us), or “Staph” is a very common germ that about 1 out of every 3 people have on their skin or in their nose. This germ does not cause any problems for most people who have it on their skin. But sometimes it can cause serious infections such as skin or wound infections, pneumonia, or infections of the blood.

Antibiotics are given to kill Staph germs when they cause infections. Some *Staph* are resistant, meaning they cannot be killed by some antibiotics. “Methicillin-resistant *Staphylococcus aureus*” or “MRSA” is a type of *Staph* that is resistant to some of the antibiotics that are often used to treat *Staph* infections.

Who is most likely to get an MRSA infection?

In the hospital, people who are more likely to get an MRSA infection are people who:

- have other health conditions making them sick
- have been in the hospital or a nursing home
- have been treated with antibiotics.

People who are healthy and who have not been in the hospital or a nursing home can also get MRSA infections. These infections usually involve the skin. More information about this type of MRSA infection, known as “community-associated MRSA” infection, is available from the Centers for Disease Control and Prevention (CDC). [http://www.cdc.gov/mrsa](http://www.cdc.gov/mrsa)

How do I get an MRSA infection?

People who have MRSA germs on their skin or who are infected with MRSA may be able to spread the germ to other people. MRSA can be passed on to bed linens, bed rails, bathroom fixtures, and medical equipment. It can spread to other people on contaminated equipment and on the hands of doctors, nurses, other healthcare providers and visitors.

Can MRSA infections be treated?

Yes, there are antibiotics that can kill MRSA germs. Some patients with MRSA abscesses may need surgery to drain the infection. Your healthcare provider will determine which treatments are best for you.

What are some of the things that hospitals are doing to prevent MRSA infections?

To prevent MRSA infections, doctors, nurses, and other healthcare providers:

- **Clean their hands** with soap and water or an alcohol-based hand rub before and after caring for every patient.
- **Carefully clean hospital rooms and medical equipment.**
- **Use Contact Precautions** when caring for patients with MRSA. Contact Precautions mean:
  - Whenever possible, patients with MRSA will have a single room or will share a room only with someone else who also has MRSA.
  - Healthcare providers will put on gloves and wear a gown over their clothing while taking care of patients with MRSA.

  o Visitors may also be asked to wear a gown and gloves.
  o When leaving the room, hospital providers and visitors remove their gown and gloves and clean their hands.
  o Patients on Contact Precautions are asked to stay in their hospital rooms as much as possible. They should not go to common areas, such as the gift shop or cafeteria. They may go to other areas of the hospital for treatments and tests.
  - **May test** some patients to see if they have MRSA on their skin. This test involves rubbing a cotton-tipped swab in the patient’s nostrils or on the skin.

What can I do to help prevent MRSA infections?

In the hospital

- Make sure that all doctors, nurses, and other healthcare providers clean their hands with soap and water or an alcohol-based hand rub before and after caring for you.

  **If you do not see your providers clean their hands, please ask them to do so.**

When you go home

- If you have wounds or an intravascular device (such as a catheter or dialysis port) make sure that you know how to take care of them.

Can my friends and family get MRSA when they visit me?

The chance of getting MRSA while visiting a person who has MRSA is very low. To decrease the chance of getting MRSA your family and friends should:

- Clean their hands before they enter your room and when they leave.
- Ask a healthcare provider if they need to wear protective gowns and gloves when they visit you.

What do I need to do when I go home from the hospital?

To prevent another MRSA infection and to prevent spreading MRSA to others:

- Keep taking any antibiotics prescribed by your doctor. Don’t take half-doses or stop before you complete your prescribed course.
- Clean your hands often, especially before and after changing your wound dressing or bandage.
- People who live with you should clean their hands often as well.
- Keep any wounds clean and change bandages as instructed until healed.
- Avoid sharing personal items such as towels or razors.
- Wash and dry your clothes and bed linens in the warmest temperatures recommended on the labels.
- Tell your healthcare providers that you have MRSA. This includes home health nurses and aides, therapists, and personnel in doctors’ offices.
- Your doctor may have more instructions for you.

If you have questions, please ask your doctor or nurse.
What is Clostridium difficile infection?

*Clostridium difficile* [pronounced Klo-STRID-um dif-uh-SEEL], also known as “*C. diff*” [See-dif], is a germ that can cause diarrhea. Most cases of *C. diff* infection occur in patients taking antibiotics. The most common symptoms of a *C. diff* infection include:

- Watery diarrhea
- Fever
- Loss of appetite
- Nausea
- Belly pain and tenderness

Who is most likely to get *C. diff* infection?

The elderly and people with certain medical problems have the greatest chance of getting *C. diff*. *C. diff* spores can live outside the human body for a very long time and may be found on things in the environment such as bed linens, bed rails, bathroom fixtures, and medical equipment. *C. diff* infection can spread from person-to-person on contaminated equipment and on the hands of doctors, nurses, other healthcare providers and visitors.

Can *C. diff* infection be treated?

Yes, there are antibiotics that can be used to treat *C. diff*. In some severe cases, a person might have to have surgery to remove the infected part of the intestines. This surgery is needed in only 1 or 2 out of every 100 persons with *C. diff*.

What are some of the things that hospitals are doing to prevent *C. diff* infections?

To prevent *C. diff* infections, doctors, nurses, and other healthcare providers:

- Clean their hands with soap and water or an alcohol-based hand rub before and after caring for every patient. This can prevent *C. diff* and other germs from being passed from one patient to another on their hands.
- Carefully clean hospital rooms and medical equipment that have been used for patients with *C. diff*.
- Use Contact Precautions to prevent *C. diff* from spreading to other patients. Contact Precautions mean:
  - Whenever possible, patients with *C. diff* will have a single room or share a room only with someone else who also has *C. diff*.
  - Healthcare providers will put on gloves and wear a gown over their clothing while taking care of patients with *C. diff*.
  - Visitors may also be asked to wear a gown and gloves.
  - When leaving the room, hospital providers and visitors remove their gown and gloves and clean their hands.

What can I do to help prevent *C. diff* infections?

- Make sure that all doctors, nurses, and other healthcare providers clean their hands with soap and water or an alcohol-based hand rub before and after caring for you.
- Only take antibiotics as prescribed by your doctor.
- Be sure to clean your own hands often, especially after using the bathroom and before eating.
- Clean their hands before they enter your room and as they leave your room
- Ask the nurse if they need to wear protective gowns and gloves when they visit you.
- Wash your hands often, especially after going to the bathroom and before preparing food.
- People who live with you should wash their hands often as well.
- If you develop more diarrhea after you get home, tell your doctor immediately.
- Your doctor may give you additional instructions.

If you have questions, please ask your doctor or nurse.
APPENDIX D. Healthcare-Associated Infections (HAI) Advisory Group, January 2015

Deverick Anderson, MD, MPH  
Duke Infection Control Outreach Network  
Duke University Medical Center
