Healthcare-Associated Infections in North Carolina

Reporting Period: January 1 – June 30, 2013

Healthcare Consumer Version (Revised November 2013)
Introduction

The prevention of healthcare-associated infections is a public health priority in North Carolina and is a collaborative effort among the healthcare and public health communities. This October 2013 Healthcare-Associated Infections report is an important product of this collaboration. Included in this report is information about infections occurring in North Carolina short-term acute care hospitals, long-term acute care hospitals, and inpatient rehabilitation facilities from January 1 through June 30, 2013. Data included in this report are preliminary and therefore subject to change.

This report focuses on three important types of healthcare-associated infections that may occur while patients are hospitalized: central line-associated bloodstream infections, catheter-associated urinary tract infections, and surgical site infections (specifically those following abdominal hysterectomies or colon surgeries). These three infections account for a large proportion of infections and deaths attributed to healthcare, but they do not represent the full spectrum of healthcare-associated infections.

This report was prepared by the North Carolina Healthcare-Associated Infections Prevention Program in the Communicable Disease Branch of the Epidemiology Section of the North Carolina Division of Public Health. The N.C. Healthcare-Associated Infections Prevention Program works to eliminate preventable infections in health care settings by:

1. Conducting statewide surveillance for selected healthcare-associated infections;
2. Providing useful, unbiased information to health care providers and consumers;
3. Promoting and coordinating prevention efforts; and
4. Responding to outbreaks in health care settings.

We hope that the information in this report will be useful to healthcare consumers. Data are intended to provide an understanding of the burden of healthcare-associated infections in North Carolina and an opportunity to evaluate infection rates across the state. Prevention tips are also provided so readers can take steps to minimize their risk of acquiring a healthcare-associated infection (Appendix C). A separate, more technical healthcare provider version of this report is also available at [http://epi.publichealth.nc.gov/cd/diseases/hai](http://epi.publichealth.nc.gov/cd/diseases/hai). We welcome your feedback to improve the usefulness of future reports ([nchai@dhhs.nc.gov](mailto:nchai@dhhs.nc.gov)).

Note to Readers on November 2013 Version:

In the October 2013 Quarterly Report, the data used to compare each hospital to similarly sized hospitals were based on the 2011 Hospital Survey. In this revised version, the rates and confidence intervals for similarly sized hospitals have been updated based on the 2012 Hospital Survey. This resulted in changes to the bar graphs for the following hospitals:

- Annie Penn Hospital, Reidsville, Rockingham County
- Caldwell Memorial Hospital, Lenoir, Caldwell County
- Carolinas Medical Center, Charlotte, Mecklenburg County
- Carolinas Medical Center-Pineville, Charlotte, Mecklenburg County
- Carolinas Medical Center-University, Charlotte, Mecklenburg County
- Catawba Valley Medical Center, Hickory, Catawba County
- Blue Ridge Healthcare Hospitals, Inc. - Morganton Campus, Morganton, Burke County
- Person Memorial Hospital, Roxboro, Person County
- Sampson Regional Medical Center, Clinton, Sampson County*
- Blue Ridge Healthcare Hospitals - Valdese Campus, Valdese, Burke County
- Vidant Roanoke Chowan Hospital, Ahoskie, Hertford County
- Wilson Medical Center, Wilson, Wilson County

*Additional updates were made to the Sampson Regional report to include all data entered as of Q2 2013 (Mar-Jun); Q1 2013 (Jan-Mar) data were still unavailable.
Acknowledgements

The North Carolina Healthcare-Associated Infections Prevention Program would like to acknowledge and thank hospital infection preventionists across the state, who work tirelessly to protect patients from infection. These preventionists provided the data used to create this report and worked with their hospital colleagues to identify and reconcile any potential problems with the data. This acknowledgement and gratitude extends to the hospital. While reporting of healthcare-associated infections is required, their support for healthcare-associated infections reporting and efforts to assure accurate reporting of infections is appreciated. The recent successes in fighting healthcare-associated infections would not have been possible without the continuing efforts, dedication and collaboration of hospitals and hospital infection preventionists.

The Healthcare-Associated Infections Prevention Program would also like to recognize the contributions of the Healthcare-Associated Infections Advisory Group members listed in Appendix D. In particular, the program is grateful to the Subgroup on Reporting and Surveillance for their thoughtful feedback on the presentation and content of these quarterly reports.

Finally, the program would like to acknowledge our partners, who have been important leaders and strong supporters of surveillance and prevention programs for healthcare-associated infections in North Carolina. These include the North Carolina Hospital Association, the North Carolina Statewide Program for Infection Control and Epidemiology, the North Carolina Chapter of the Association for Professionals in Infection Control and Epidemiology, the Carolinas Center for Medical Excellence, and the Adult Care Licensure and Nursing Home Licensure and Certification sections of the North Carolina Division of Health Service Regulation.

I. Surveillance for Healthcare-Associated Infections in North Carolina

Healthcare-associated infections (HAIs) are infections caused by a variety of organisms – such as bacteria, viruses and fungi – contracted while receiving medical care. As part of the concerted effort to reduce these infections, hospitals report specific types of HAIs to the N.C. Division of Public Health (DPH) as required by law (General Statute 130A-150). Since 2012, they have been reporting central line-associated bloodstream infections (CLABSI), catheter-associated urinary tract infections (CAUTI), and surgical site infections (SSI) occurring after inpatient abdominal hysterectomies or colon surgeries. Beginning in January 2013, short-term acute care hospitals began reporting of laboratory-confirmed (LabID) bloodstream infections caused by methicillin-resistant Staphylococcus aureus (MRSA) and infections caused by Clostridium difficile (C. diff).

By North Carolina law, hospital reporting requirements are based on the reporting requirements established by the Centers for Medicare and Medicaid Services (CMS).

HAI information is entered into the National Healthcare Safety Network (NHSN), a web-based surveillance system administered by the Center for Disease Control and Prevention. The N.C. HAI Program works with hospitals on a monthly basis to ensure their data are accurate and timely. All data in NHSN are entered and modified by hospitals; the N.C. HAI Program cannot change data in NHSN.

To learn more about CLABSIs, CAUTIs, SSIs, MRSA, Clostridium difficile and other HAIs, please visit the N.C. Healthcare-Associated Infections website at http://epi.publichealth.nc.gov/cd/diseases/hai.html. In addition to information about specific infections, there is a link to the “Facts and Figures” webpage (http://epi.publichealth.nc.gov/cd/hai/figures.html), which includes current and previous reports. The Healthcare-Associated Infection in North Carolina - Reference Report issued in October 2012 and revised in June 2013, contains background information on HAIs, HAI surveillance in North Carolina, and detailed information on statistics commonly used to describe and summarize HAIs. Subsequent reports, published quarterly, cover timely state-level and facility-specific data on the incidence of healthcare associated infections in hospitals across the state, as well as information on the creation and progress of various initiatives to reduce HAIs.

According to N.C. Administrative Code rule 10A NCAC 41A .0106, North Carolina hospitals are required to report the healthcare-associated infections listed in the CMS-IPPS Rule.1 A list of these conditions and the starting dates for reporting are included in Table 1.

II. Hospital-Specific Summary Reports
A. Explanation of the Hospital-Specific Summary Reports

Each hospital-specific summary report contains up to five sections: 1) general hospital information, 2) central line-associated bloodstream infections (CLABSI), 3) catheter associated urinary tract infections (CAUTI), 4) surgical site infections (SSI) after abdominal hysterectomies and colon surgeries, and 5) commentary from the hospital. These sections are described below.

Note: Data on LabID events will be published at a later date.

These reports cover the first six months of 2013 and data were downloaded from NHSN on September 12, 2013; any changes made to the data after this date are not reflected in this report. Before reviewing this report, a few clarifications about the data need to be made:

1. The data are preliminary. Although efforts were made by hospitals and the N.C. HAI Program to ensure that the data were accurate and complete, a formal validation of the data has not yet been performed. Until data validation is completed, data should be interpreted with caution.

2. The data were self-reported. Although efforts were made through education and training to improve understanding of NHSN surveillance guidelines, definitions, and criteria, there can be variability in interpretation and application, leading to differences in reporting practices among hospitals. This issue will be addressed by data validation.

3. The rates of infections were not included for HAIs in a few facilities. Calculating rates with small numbers in the denominator will lead to an unstable estimate. Therefore the N.C. HAI Program chose not to present rates for units, procedures or hospitals that did not meet a minimum threshold value for the reporting period. The minimum quarterly threshold numbers are based on CDC recommendations for reporting healthcare-associated infection data:
   - Central line-associated bloodstream infections: 50 central line days;
   - Catheter-associated urinary tract infections: 50 catheter days; and
   - Surgical site infections: 20 surgeries.

1. 2012 Hospital Survey Information

This section contains general information about the hospital and includes a map of where the hospital (blue “H” icon) is located in North Carolina. Data in this section are from the NHSN 2012 Annual Hospital Survey.

2. Central Line-Associated Bloodstream Infections (CLABSI)

Short-term acute care hospitals

CLABSIs are reported from hospitals with ICUs (adult, pediatric, and neonatal). Data are presented at the hospital-level and include a table with the number of CLABSIs, central line days, and rate. The rate is the number of CLABSIs divided by the number of central line days multiplied by 1,000 to get “per 1,000 central line days.” A figure is also included to show the hospital CLABSI rate in comparison to other similarly-sized short-term acute care hospitals and N.C. Interpretations of rate comparison are also provided (Table 1).

Long-term acute care hospitals

CLABSIs are reported from adult and pediatric ICUs and wards. As with short-term acute care hospitals, this section includes a table and a figure about CLABSIs at the hospital-level. The data included in the table are the number of CLABSIs, central line
days, and rate. The figure in this section includes the hospital CLABSI rate in comparison to all other long-term acute care hospitals in N.C. An interpretation of the rate comparison is provided (see Table 1).

3. Catheter-Associated Urinary Tract Infections (CAUTI)

Short-term acute care hospitals
CAUTIs are reported from adult and pediatric ICUs and inpatient rehabilitation wards. Like the section on CLABSIs, this section includes a table and figure about CAUTIs.

Long-term acute care hospitals
CAUTIs are reported from adult and pediatric ICUs and wards. The content of the CAUTI section for long-term acute care hospitals is similar to CLABSIs in long-term acute care hospitals.

Inpatient rehabilitation facilities
CAUTIs are reported from adult and pediatric rehabilitation wards. Hospital-specific summary reports are only generated for free-standing inpatient rehabilitation facilities; data from inpatient rehabilitation wards within short-term acute care hospitals are included in their respective hospital-specific summary reports.

Data in the tables are at the hospital-level and includes the number of CAUTI infections, number of catheter days, and the CAUTI rate for all reporting wards. The figure includes the CAUTI rate for the facility in comparison to all other rehabilitation wards in N.C., both free-standing and within short-term acute care hospitals. An interpretation of the rate comparison is provided (See Table 1).

4. Surgical Site Infections (SSI) – Abdominal Hysterectomies and Colon Surgeries

Abdominal Hysterectomies

Short-term acute care hospitals
SSIs are reported among female adults 18 years or older following inpatient abdominal hysterectomies. Only SSIs that occurred at the primary incision site within 30 days of the surgery are included in the report. Infections are not included if they occurred after 30 days post-operation or if they involved only the skin or subcutaneous tissues. Finally, if patient age or the American Society of Anesthesiologists (ASA) score was missing for a surgery, it was classified as an “incomplete procedure” and is not included in the final count of surgeries. The content for this section is similar to the CLABSI and CAUTI sections.

Colon Surgeries

Short-term acute care hospitals
SSIs are reported among adults 18 years or older following inpatient colon surgeries. Only SSIs that occurred at the primary incision site within 30 days of surgery are included in the report. Infections are not included if they occurred after 30 days post-operation or if they involved only the skin or subcutaneous tissues. Finally, if patient age or the American Society of Anesthesiologists (ASA) score was missing for a surgery, it was classified as an “incomplete procedure” and is not included in the final count of surgeries. The content for this section is similar to the CLABSI and CAUTI sections.

5. Commentary from Hospital

This section includes hospital comments on their HAI data and current infection control activities. Hospitals can provide a link to their hospital website to provide lengthier comments.

Statistics

For a detailed explanation of statistics included in the HAI reports, see the N.C.DHHS HAI in N.C. report issued October 2012 and revised June 2013 (http://epi.publichealth.nc.gov/cd/hai/figures.html). Explanations on concepts such as statistical significance and computation of measures including rates and standardized infection ratios (SIRs) are provided.

For further explanation of the HAI tables and graphs presented for each hospital, consult Chapter II of the January 2013 N.C. HAI report for Healthcare Consumers, pages 2-6 (http://epi.publichealth.nc.gov/cd/hai/figures.html).

### Commentary from Hospitals:

The prevention and reduction of healthcare associated infections is a top priority at Blue Ridge Healthcare Hospitals Valdese. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Conference from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under ‘quality’ on NovantHealth.org.

Data as of September 12, 2013.
NC Division of Public Health, HAI Prevention Program
NC HAI Quarterly Report (Consumer Version) - Oct 2013
The prevention and reduction of healthcare associated infections is a top priority at Carolinas Healthcare System hospitals. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Central Line-Associated Bloodstream Infections (CLABSI)

Bar Graph Interpretations:
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Catheter-Associated Urinary Tract Infections (CAUTI)

Bar Graph Interpretations:
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is higher than NC hospitals overall.

Surgical Site Infections (SSI)

Bar Graph Interpretations (Abdominal Hysterectomies):
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Bar Graph Interpretations (Colon Surgeries):
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

**Commentary from Hospitals:**

The prevention and reduction of healthcare associated infections is a top priority at Cleveland County Healthcare System hospitals. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Commentary from Hospitals:
Over the past year, FirstHealth has strived to continue to reduce our infections by continuing to educate staff on infection prevention, emphasizing hand hygiene, and following all evidence based practices to reduce infections. We have worked to decrease use of urinary catheters and worked with our operating room to assure all measures are taken to prevent surgical site infections such as appropriate use of antibiotics. We are also participating in the Partnership for Patients Collaborative with the North Carolina Quality Center.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under ‘quality’ on NovantHealth.org.

A comparison to NC hospitals overall was not conducted.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under ‘quality’ on NovantHealth.org.

A comparison to similarly-sized hospitals was not conducted.
A comparison to NC hospitals overall was not conducted.

Commentary from Hospitals:
FRMC has zero central line bloodstream infections. We implemented an alcohol impregnated port protector that guards against infection by keeping the needleless valves of central lines protected and clean. Foley catheter related urinary tract infection is a challenge and we continue to work on removing the catheter when not necessary. Our commitment to the prevention of infections is a goal we take very seriously. Our commitment to our community to make certain our processes and policies are in line with achieving zero infections.

NC HAI Quarterly Report (Consumer Version) - Oct 2013
The prevention and reduction of healthcare associated infections is a top priority at MedWest-Haywood, an affiliation of Carolinas Healthcare System. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Figure 4. Rates and 95% Confidence Intervals for Colon Surgeries, Jan-Jun 2013.

Commentary from Hospitals:
The prevention and reduction of healthcare associated infections is a top priority at Cleveland County Healthcare System hospitals. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under ‘quality’ on NovantHealth.org.

NC HAI Quarterly Report (Consumer Version) - Oct 2013 58
At New Hanover Regional Medical Center we take patient safety and quality care extremely seriously. We implement the latest science-based protocols to prevent hospital-acquired infection. We study and adopt best practices, evidence-based medicine and recommendations from national agencies to deliver the best possible outcomes for our patients. We encourage patients and their families to take an active role in helping prevent infections. Our team of infection preventionists works with all staff to ensure they are focused on delivering the highest quality of care possible. We are proud of our success and our ongoing quest to keep preventable infections to an absolute minimum.

Central Line-Associated Bloodstream Infections (CLABSI)

Table 1. Number of Infections and Rate of CLABSI, Jan-Jun 2013.

<table>
<thead>
<tr>
<th>Infections</th>
<th>Line Days</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total for Reporting ICUs</td>
<td>2</td>
<td>4,431</td>
</tr>
</tbody>
</table>

Note: Rate per 1,000 central line days. Rate was not calculated if less than 50 central line days.

Bar Graph Interpretations:
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Catheter-Associated Urinary Tract Infections (CAUTI)

Table 2. Number of Infections and Rate of CAUTI, Jan-Jun 2013.

<table>
<thead>
<tr>
<th>Infections</th>
<th>Catheter Days</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total for Reporting ICUs</td>
<td>9</td>
<td>2,703</td>
</tr>
</tbody>
</table>

Note: Rate per 1,000 catheter days. Rate was not calculated if less than 50 catheter days.

Bar Graph Interpretations:
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Surgical Site Infections (SSI)

Table 3. Number of Infections and Rate of SSI, Jan-Jun 2013.

<table>
<thead>
<tr>
<th>Type of Surgery</th>
<th>Infections*</th>
<th>Surgeries</th>
<th>Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abdominal hysterectomy</td>
<td>1</td>
<td>116</td>
<td>0.86</td>
</tr>
<tr>
<td>Colon surgery</td>
<td>5</td>
<td>130</td>
<td>3.85</td>
</tr>
</tbody>
</table>

*Infections from deep incisional and/or organ space.
Note: Rate per 100 inpatient surgeries. Rate was not calculated if less than 20 inpatient surgeries.

Bar Graph Interpretations (Abdominal Hysterectomies):
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Bar Graph Interpretations (Colon Surgeries):
Hospital rate is not different from similarly-sized hospitals.
Hospital rate is not different from NC hospitals overall.

Commentary from Hospitals:
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under ‘quality’ on NovantHealth.org.

Refer to the HAI in NC Reference Report - October 2012 (rev June 2013) for further explanation of presented statistics (epi.publichealth.nc.gov/cd/hai/figures.html).
Data as of September 12, 2013.

**Commentary from Hospitals:**
At Novant Health, the safety of our patients comes first. Our goal is to have the lowest possible infection rates and we continually monitor infection prevention tactics for improvement opportunities. We support transparency in reporting infection rates and make common infection data available on our website. More information can be found under ‘quality’ on NovantHealth.org.

Figure 4. Rates and 95% Confidence Intervals for Colon Surgeries, Jan-Jun 2013.

Commentary from Hospitals:
UNC Health Care is pleased that our rates of all reported healthcare-associated infections are statistically similar to similarly-sized hospitals despite care in a tertiary referral hospital for highly vulnerable populations (e.g., organ transplant, HIV infected, cancer, severely burned, and very premature infants). NC residents should be aware that the reported information is NOT corrected for the severity of illness of the hospital’s patients. UNC Health Care supports the need for the data presented in this report to be validated (i.e., demonstration by independent monitors that the submitted data is correct).

NC Division of Public Health, HAI Prevention Program  
NC HAI Quarterly Report (Consumer Version) - Oct 2013
The prevention and reduction of healthcare associated infections is a top priority at Wilkes Regional Medical Center. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

Refer to the HAI in NC Reference Report - October 2012 (rev June 2013) for further explanation of presented statistics (epi.publichealth.nc.gov/cd/hai/figures.html). Data as of September 12, 2013.

Note: Rate per 1,000 catheter days. Rate was not calculated if less than 50 catheter days.

Bar Graph Interpretations:
Hospital rate is not different from all reporting inpatient rehabilitation wards in NC.

Figure 1. Rates and 95% Confidence Intervals, Jan-Jun 2013.

Other Healthcare-Associated Infections (HAIs)

Inpatient rehabilitation facilities (IRFs) do not report CLABSI, LabID C. difficile, LabID MRSA Bacteremia or SSIs to the N.C. Division of Public Health.

Commentary from Hospitals:
The prevention and reduction of healthcare associated infections is a top priority at Carolinas Healthcare System hospitals. To accomplish this, infection prevention strategies are continually assessed and measures implemented to decrease the risk for infection. These measures are based on evidence based practices and clinical guidelines. A comprehensive program is provided that encompasses patient care and patient safety.

APPENDICES
### APPENDIX A. Definitions

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acute care hospital</td>
<td>A hospital that provides acute medical care due to illness, injury or following surgery to patients hospitalized for a brief period of time.</td>
</tr>
<tr>
<td>ASA Class</td>
<td>Anesthesiologist’s pre-operative assessment of the patient’s physical condition, using the American Society of Anesthesiologists’ (ASA) Classification of Physical Status.</td>
</tr>
<tr>
<td></td>
<td>1. Normally healthy patient</td>
</tr>
<tr>
<td></td>
<td>2. Patient with mild systemic disease</td>
</tr>
<tr>
<td></td>
<td>3. Patient with severe systemic disease that is not incapacitating</td>
</tr>
<tr>
<td></td>
<td>4. Patient with an incapacitating systemic disease, constant threat to life</td>
</tr>
<tr>
<td></td>
<td>5. Patient not expected to survive for 24 hours with or without the operation</td>
</tr>
<tr>
<td>Bacteremia</td>
<td>Bloodstream infection (BSI).</td>
</tr>
<tr>
<td>Beds</td>
<td>The number of staffed beds in a facility or patient care location. This may be different from the number of licensed beds.</td>
</tr>
<tr>
<td>Catheter days</td>
<td>A daily count of the number of patients with an indwelling urinary catheter. For example, one patient with an indwelling catheter in place for two days or two patients with indwelling catheters in place for one day each would both result in two catheter days. This number is used when presenting rates of catheter-associated urinary tract infections.</td>
</tr>
<tr>
<td>Catheter-associated urinary tract infection</td>
<td>Urinary tract infection (UTI) that occurs in a patient who had an indwelling urinary catheter in place within the 48-hour period before the onset of the UTI.</td>
</tr>
<tr>
<td>Central line</td>
<td>A catheter (tube) that doctors place in a large vein in the neck, chest, or groin ending in a large vein near the heart. It is used to give medication or fluids or to collect blood for medical tests. Also known as a central venous catheter.</td>
</tr>
<tr>
<td>Central line-associated bloodstream infection</td>
<td>A bloodstream infection (BSI) that occurs in a patient who had a central line within the 48-hour period before the onset of the BSI and is not related to an infection at another site.</td>
</tr>
<tr>
<td>Central line days</td>
<td>A daily count of the number of patients with a central line. For example, one patient with a central line in place for two days or two patients with central lines in place for one day each would both result in two central line days. This number is used when presenting rates of central line-associated bloodstream infections.</td>
</tr>
<tr>
<td>Device days</td>
<td>A daily count of the number of patients with a specific device (e.g., central line, umbilical catheter, or urinary catheter) in the patient care location. For example, one patient with a device in place for two days or two patients with devices in place for one day each would both result in two device days. This number is used when presenting rates of infections associated with the use of devices.</td>
</tr>
<tr>
<td>Full-time equivalent</td>
<td>The equivalent of one person working full time for one year: 8 hour per day at 5 days per week for 52 weeks per year = 2080 hours per year</td>
</tr>
<tr>
<td>Hand hygiene</td>
<td>A general term that applies to routine hand washing, antiseptic hand wash, antiseptic hand rub, or surgical hand antisepsis.</td>
</tr>
<tr>
<td></td>
<td><em>Routine hand washing</em> is the use of clean water and non-antimicrobial soap to remove germs, soil and other debris from the hands.</td>
</tr>
<tr>
<td></td>
<td><em>Antiseptic hand washing</em> is the use of water and antimicrobial soap to remove or kill germs on the hands.</td>
</tr>
<tr>
<td></td>
<td><em>Antiseptic hand rub</em> is the use of alcohol-based hand rubs to remove or destroy susceptible germs from the hands. Antiseptic hand rubs are less effective when hands are visibly dirty and against some viruses.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hand hygiene (cont)</td>
<td><em>Surgical hand antisepsis</em> is the use of water, antimicrobial soap and a brush to remove or kill germs and takes 2-6 minutes to complete as both hands and forearms are cleaned. Water and non-antimicrobial soap can also be used but must be followed with an alcohol-based surgical hand scrub.</td>
</tr>
<tr>
<td>Healthcare-associated infections</td>
<td>Healthcare-associated infections (HAI) are infections caused by a wide variety of common and unusual bacteria, fungi, and viruses that occur during the course of receiving medical care.</td>
</tr>
<tr>
<td>Inpatient rehabilitation facility</td>
<td>A facility that provides rehabilitation services after injury, illness, or surgery. These may be free-standing facilities or specialized units within a hospital.</td>
</tr>
<tr>
<td>Intensive care unit</td>
<td>A nursing care area that provides intensive observation, diagnosis, and therapeutic procedures for adults and/or children who are critically ill. Also referred to as critical care unit.</td>
</tr>
<tr>
<td>Laboratory-identified <em>Clostridium difficile</em></td>
<td>A positive laboratory test result for <em>Clostridium difficile</em>.</td>
</tr>
<tr>
<td>Laboratory-identified <em>Staphylococcus aureus</em> bacteremia</td>
<td><em>Staphylococcus aureus</em> cultured from blood specimens that is oxacillin-resistant, cefoxitin-resistant, or methicillin-resistant by standard susceptibility testing methods, or by a laboratory test that is FDA-approved for MRSA detection from isolated colonies.</td>
</tr>
<tr>
<td>Long term acute care hospital</td>
<td>A hospital that provides acute medical care due to illness, injury or following surgery but the average length of patient stay is greater than 25 days.</td>
</tr>
</tbody>
</table>
| Medical affiliation                     | Affiliation with a medical school. There are four categories:  

  * Major - Facility has a program for medical students and post-graduate medical training.  
  * Graduate - Facility has a program for post-graduate medical training (i.e., residency and/or fellowships).  
  * Undergraduate - Facility has a program for medical students only.  
  * No – Hospital not affiliated with a medical school.  |
| Patient days                            | A daily count of the number of patients in the patient care location during a specified time period.                                               |
| Rate                                    | Describes the speed with which disease or events occur. The number of diseases or events per unit of time.                                           |
| Standardized infection ratio            | A ratio of observed to expected (or predicted) numbers of events that is adjusted for selected risk factors.                                    |
| Surgical site infection                 | Infection that occurs after surgery, in the part of the body where the surgery took place.                                                   |
| Umbilical catheter                      | Long, thin plastic tubes that travel from the stump of a newborn baby's umbilical cord into the large vessels near the heart                      |
| Urinary catheter                        | A drainage tube that is inserted into the urinary bladder through the urethra, is left in place, and is connected to a closed collection system.  |
| Validity (data)                         | The extent to which reported cases of a disease or event correspond accurately to cases of a disease event that actually occurred. |

What is a catheter-associated bloodstream infection?
A “central line” or “central catheter” is a tube that is placed into a patient’s large vein, usually in the neck, chest, arm, or groin. The catheter is often used to draw blood, or give fluids or medications. It may be left in place for several weeks. A bloodstream infection can occur when bacteria or other germs travel down a “central line” and enter the blood. If you develop a catheter-associated bloodstream infection you may become ill with fevers and chills or the skin around the catheter may become sore and red.

Can a catheter-related bloodstream infection be treated?
A catheter-associated bloodstream infection is serious, but often can be successfully treated with antibiotics. The catheter might need to be removed if you develop an infection.

What are some of the things that hospitals are doing to prevent catheter-associated bloodstream infections?
To prevent catheter-associated bloodstream infections doctors and nurses will:
- Choose a vein where the catheter can be safely inserted and where the risk for infection is small.
- Clean their hands with soap and water or an alcohol-based hand rub before putting in the catheter.
- Wear a mask, cap, sterile gown, and sterile gloves when putting in the catheter to keep it sterile. The patient will be covered with a sterile sheet.
- Clean the patient’s skin with an antiseptic cleanser before putting in the catheter.
- Clean the catheter opening with an antiseptic solution before using the catheter to draw blood or give medications. Healthcare providers also clean their hands and wear gloves when changing the bandage that covers the area where the catheter enters the skin.
- Decide every day if the patient still needs to have the catheter. The catheter will be removed as soon as it is no longer needed.
- Carefully handle medications and fluids that are given through the catheter.

What can I do to help prevent a catheter-associated bloodstream infection?
- Ask your doctors and nurses if they will be using all of the prevention methods discussed above.
- Make sure that all doctors and nurses caring for you clean their hands with soap and water or an alcohol-based hand rub before and after caring for you.

If you do not see your providers clean their hands, please ask them to do so.
- If the bandage comes off or becomes wet or dirty, tell your nurse or doctor immediately.
- Inform your nurse or doctor if the area around your catheter is sore or red.
- Do not let family and friends who visit touch the catheter or the tubing.
- Make sure family and friends clean their hands with soap and water or an alcohol-based hand rub before and after visiting you.

What do I need to do when I go home from the hospital?
Some patients are sent home from the hospital with a catheter in order to continue their treatment. If you go home with a catheter, your doctors and nurses will explain everything you need to know about taking care of your catheter.
- Make sure you understand how to care for the catheter before leaving the hospital. For example, ask for instructions on showering or bathing with the catheter and how to change the catheter dressing.
- Make sure you know who to contact if you have questions or problems after you get home.
- Make sure you wash your hands with soap and water or an alcohol-based hand rub before handling your catheter.
- Watch for the signs and symptoms of catheter-associated bloodstream infection, such as soreness or redness at the catheter site or fever, and call your healthcare provider immediately if any occur.

FAQs (frequently asked questions) about “Catheter-Associated Urinary Tract Infection”

What is “catheter-associated urinary tract infection”?
A urinary tract infection (also called “UTI”) is an infection in the urinary system, which includes the bladder (which stores the urine) and the kidneys (which filter the blood to make urine). Germs (for example, bacteria or yeasts) do not normally live in these areas; but if germs are introduced, an infection can occur.

If you have a urinary catheter, germs can travel along the catheter and cause an infection in your bladder or your kidney; in that case it is called a catheter-associated urinary tract infection (or “CA-UTI”).

What is a urinary catheter?
A urinary catheter is a thin tube placed in the bladder to drain urine. Urine drains through the tube into a bag that collects the urine. A urinary catheter may be used:
- If you are not able to urinate on your own
- To measure the amount of urine that you make, for example, during intensive care
- During and after some types of surgery
- During some tests of the kidneys and bladder

People with urinary catheters have a much higher chance of getting a urinary tract infection than people who don’t have a catheter.

How do I get a catheter-associated urinary tract infection (CA-UTI)?
If germs enter the urinary tract, they may cause an infection. Many of the germs that cause a catheter-associated urinary tract infection are common germs found in your intestines that do not usually cause an infection there. Germs can enter the urinary tract when the catheter is being put in or while the catheter remains in the bladder.

What are the symptoms of a urinary tract infection?
Some of the common symptoms of a urinary tract infection are:
- Burning or pain in the lower abdomen (that is, below the stomach)
- Fever
- Bloody urine may be a sign of infection, but is also caused by other problems
- Burning during urination or an increase in the frequency of urination

Sometimes people with catheter-associated urinary tract infections do not have these symptoms of infection.

Can catheter-associated urinary tract infections be treated?
Yes, most catheter-associated urinary tract infections can be treated with antibiotics and removal or change of the catheter. Your doctor will determine which antibiotic is best for you.

What are some of the things that hospitals are doing to prevent catheter-associated urinary tract infections?
To prevent urinary tract infections, doctors and nurses take the following actions.

Catheter insertion
- Catheters are put in only when necessary and they are removed as soon as possible.
- Only properly trained persons insert catheters using sterile (“clean”) technique.
- The skin in the area where the catheter will be inserted is cleaned before inserting the catheter.
- Other methods to drain the urine are sometimes used, such as:
  - External catheters in men (these look like condoms and are placed over the penis rather than into the penis)
  - Putting a temporary catheter in to drain the urine and removing it right away. This is called intermittent urethral catheterization.

Catheter care
- Healthcare providers clean their hands by washing them with soap and water or using an alcohol-based hand rub before and after touching your catheter.
  
  If you do not see your providers clean their hands, please ask them to do so.
- Avoid disconnecting the catheter and drain tube. This helps to prevent germs from getting into the catheter tube.
- The catheter is secured to the leg to prevent pulling on the catheter.
- Avoid twisting or kinking the catheter.
- Keep the bag lower than the bladder to prevent urine from backflowing to the bladder.
- Empty the bag regularly. The drainage spout should not touch anything while emptying the bag.

What can I do to help prevent catheter-associated urinary tract infections if I have a catheter?
- Always clean your hands before and after doing catheter care.
- Always keep your urine bag below the level of your bladder.
- Do not tug or pull on the tubing.
- Do not twist or kink the catheter tubing.
- Ask your healthcare provider each day if you still need the catheter.

What do I need to do when I go home from the hospital?
- If you will be going home with a catheter, your doctor or nurse should explain everything you need to know about taking care of the catheter. Make sure you understand how to care for it before you leave the hospital.
- If you develop any of the symptoms of a urinary tract infection, such as burning or pain in the lower abdomen, fever, or an increase in the frequency of urination, contact your doctor or nurse immediately.
- Before you go home, make sure you know who to contact if you have questions or problems after you get home.

If you have questions, please ask your doctor or nurse.
What is a Surgical Site Infection (SSI)?
A surgical site infection is an infection that occurs after surgery in the part of the body where the surgery took place. Most patients who have surgery do not develop an infection. However, infections develop in about 1 to 3 out of every 100 patients who have surgery.

Some of the common symptoms of a surgical site infection are:
- Redness and pain around the area where you had surgery
- Drainage of cloudy fluid from your surgical wound
- Fever

Can SSIs be treated?
Yes. Most surgical site infections can be treated with antibiotics. The antibiotic given to you depends on the bacteria (germs) causing the infection. Sometimes patients with SSIs also need another surgery to treat the infection.

What are some of the things that hospitals are doing to prevent SSIs?
To prevent SSIs, doctors, nurses, and other healthcare providers:
- Clean their hands and arms up to their elbows with an antiseptic agent just before the surgery.
- Clean their hands with soap and water or an alcohol-based hand rub before and after caring for each patient.
- May remove some of your hair immediately before your surgery using electric clippers if the hair is in the same area where the procedure will occur. They should not shave you with a razor.
- Wear special hair covers, masks, gowns, and gloves during surgery to keep the surgery area clean.
- Give you antibiotics before your surgery starts. In most cases, you should get antibiotics within 60 minutes before the surgery starts and the antibiotics should be stopped within 24 hours after surgery.
- Clean the skin at the site of your surgery with a special soap that kills germs.

What can I do to help prevent SSIs?

**Before your surgery:**
- Tell your doctor about other medical problems you may have. Health problems such as allergies, diabetes, and obesity could affect your surgery and your treatment.
- Quit smoking. Patients who smoke get more infections. Talk to your doctor about how you can quit before your surgery.
- Do not shave near where you will have surgery. Shaving with a razor can irritate your skin and make it easier to develop an infection.

**At the time of your surgery:**
- Speak up if someone tries to shave you with a razor before surgery. Ask why you need to be shaved and talk with your surgeon if you have any concerns.
- Ask if you will get antibiotics before surgery.

**After your surgery:**
- Make sure that your healthcare providers clean their hands before examining you, either with soap and water or an alcohol-based hand rub.
- Family and friends who visit you should not touch the surgical wound or dressings.
- Family and friends should clean their hands with soap and water or an alcohol-based hand rub before and after visiting you. If you do not see them clean their hands, ask them to clean their hands.

What do I need to do when I go home from the hospital?
- Before you go home, your doctor or nurse should explain everything you need to know about taking care of your wound. Make sure you understand how to care for your wound before you leave the hospital.
- Always clean your hands before and after caring for your wound.
- Before you go home, make sure you know who to contact if you have questions or problems after you get home.
- If you have any symptoms of an infection, such as redness and pain at the surgery site, drainage, or fever, call your doctor immediately.

If you have additional questions, please ask your doctor or nurse.

What is MRSA?

*Staphylococcus aureus* (pronounced staff-ill-oh-KOK-us AW-ree-us), or “Staph” is a very common germ that about 1 out of every 3 people have on their skin or in their nose. This germ does not cause any problems for most people who have it on their skin. But sometimes it can cause serious infections such as skin or wound infections, pneumonia, or infections of the blood.

Antibiotics are given to kill Staph germs when they cause infections. Some *Staph* are resistant, meaning they cannot be killed by some antibiotics. “Methicillin-resistant *Staphylococcus aureus*” or “MRSA” is a type of *Staph* that is resistant to some of the antibiotics that are often used to treat *Staph* infections.

Who is most likely to get an MRSA infection?

In the hospital, people who are more likely to get an MRSA infection are people who:

- have other health conditions making them sick
- have been in the hospital or a nursing home
- have been treated with antibiotics.

People who are healthy and who have not been in the hospital or a nursing home can also get MRSA infections. These infections usually involve the skin. More information about this type of MRSA infection, known as “community-associated MRSA” infection, is available from the Centers for Disease Control and Prevention (CDC): [http://www.cdc.gov/mrsa](http://www.cdc.gov/mrsa)

How do I get an MRSA infection?

People who have MRSA germs on their skin or who are infected with MRSA may be able to spread the germ to other people. MRSA can be passed on to bed linens, bed rails, bathroom fixtures, and medical equipment. It can spread to other people on contaminated equipment and on the hands of doctors, nurses, other healthcare providers and visitors.

Can MRSA infections be treated?

Yes, there are antibiotics that can kill MRSA germs. Some patients with MRSA abscesses may need surgery to drain the infection. Your healthcare provider will determine which treatments are best for you.

What are some of the things that hospitals are doing to prevent MRSA infections?

To prevent MRSA infections, doctors, nurses, and other healthcare providers:

- **Clean their hands** with soap and water or an alcohol-based hand rub before and after caring for every patient.
- **Carefully clean hospital rooms and medical equipment.**
- **Use Contact Precautions** when caring for patients with MRSA. Contact Precautions mean:
  - Whenever possible, patients with MRSA will have a single room or will share a room only with someone else who also has MRSA.
  - Healthcare providers will put on gloves and wear a gown over their clothing while taking care of patients with MRSA.

What can I do to help prevent MRSA infections?

**In the hospital**

- Make sure that all doctors, nurses, and other healthcare providers clean their hands with soap and water or an alcohol-based hand rub before and after caring for you.

**When you go home**

- If you have wounds or an intravascular device (such as a catheter or dialysis port) make sure that you know how to take care of them.

Can my friends and family get MRSA when they visit me?

The chance of getting MRSA while visiting a person who has MRSA is very low. To decrease the chance of getting MRSA your family and friends should:

- Clean their hands before they enter your room and when they leave.
- Ask a healthcare provider if they need to wear protective gowns and gloves when they visit you.

What do I need to do when I go home from the hospital?

To prevent another MRSA infection and to prevent spreading MRSA to others:

- **Keep taking any antibiotics prescribed by your doctor. Don’t take half-doses or stop before you complete your prescribed course.**
- **Clean your hands often, especially before and after changing your wound dressing or bandage.**
- **People who live with you should clean their hands often as well.**
- **Keep any wounds clean and change bandages as instructed until healed.**
- **Avoid sharing personal items such as towels or razors.**
- **Wash and dry your clothes and bed linens in the warmest temperatures recommended on the labels.**
- **Tell your healthcare providers that you have MRSA. This includes home health nurses and aides, therapists, and personnel in doctors’ offices.**
- **Your doctor may have more instructions for you.**

If you have questions, please ask your doctor or nurse.
**FAQs (frequently asked questions)**

### “Clostridium Difficile”

#### What is Clostridium difficile infection?

*Clostridium difficile* [pronounced Klo-STRID-ee-um dif-uh-SEEL], also known as “C. diff” [See-dif], is a germ that can cause diarrhea. Most cases of *C. diff* infection occur in patients taking antibiotics. The most common symptoms of a *C. diff* infection include:

- Watery diarrhea
- Fever
- Loss of appetite
- Nausea
- Belly pain and tenderness

#### Who is most likely to get *C. diff* infection?

The elderly and people with certain medical problems have the greatest chance of getting *C. diff*. *C. diff* spores can live outside the human body for a very long time and may be found on things in the environment such as bed linens, bed rails, bathroom fixtures, and medical equipment. *C. diff* infection can spread from person-to-person on contaminated equipment and on the hands of doctors, nurses, other healthcare providers and visitors.

#### Can *C. diff* infection be treated?

Yes, there are antibiotics that can be used to treat *C. diff*. In some severe cases, a person might have to have surgery to remove the infected part of the intestines. This surgery is needed in only 1 or 2 out of every 100 persons with *C. diff*.

#### What are some of the things that hospitals are doing to prevent *C. diff* infections?

To prevent *C. diff* infections, doctors, nurses, and other healthcare providers:

- Clean their hands with soap and water or an alcohol-based hand rub before and after caring for every patient. This can prevent *C. diff* and other germs from being passed from one patient to another on their hands.
- Carefully clean hospital rooms and medical equipment that have been used for patients with *C. diff*.
- Use Contact Precautions to prevent *C. diff* from spreading to other patients. Contact Precautions mean:
  - Whenever possible, patients with *C. diff* will have a single room or share a room only with someone else who also has *C. diff*.
  - Healthcare providers will put on gloves and wear a gown over their clothing while taking care of patients with *C. diff*.
  - Visitors may also be asked to wear a gown and gloves.
  - When leaving the room, hospital providers and visitors remove their gown and gloves and clean their hands.
- Patients on Contact Precautions are asked to stay in their hospital rooms as much as possible. They should not go to common areas, such as the gift shop or cafeteria. They can go to other areas of the hospital for treatments and tests.
- Only give patients antibiotics when it is necessary.

#### What can I do to help prevent *C. diff* infections?

- Make sure that all doctors, nurses, and other healthcare providers clean their hands with soap and water or an alcohol-based hand rub before and after caring for you.

If you do not see your providers clean their hands, please ask them to do so.

- Only take antibiotics as prescribed by your doctor.
- Be sure to clean your own hands often, especially after using the bathroom and before eating.

#### Can my friends and family get *C. diff* when they visit me?

*C. diff* infection usually does not occur in persons who are not taking antibiotics. Visitors are not likely to get *C. diff*. Still, to make it safer for visitors, they should:

- Clean their hands before they enter your room and as they leave your room
- Ask the nurse if they need to wear protective gowns and gloves

#### What do I need to do when I go home from the hospital?

Once you are back at home, you can return to your normal routine. Often, the diarrhea will be better or completely gone before you go home. This makes giving *C. diff* to other people much less likely. There are a few things you should do, however, to lower the chances of developing *C. diff* infection again or of spreading it to others:

- If you are given a prescription to treat *C. diff*, take the medicine exactly as prescribed by your doctor and pharmacist. Do not take half-doses or stop before you run out.
- Wash your hands often, especially after going to the bathroom and before preparing food.
- People who live with you should wash their hands often as well.
- If you develop more diarrhea after you get home, tell your doctor immediately.
- Your doctor may give you additional instructions.

If you have questions, please ask your doctor or nurse.
