Technical Notes

Readers should note that fluctuations in the number of disease reports per year may be influenced by reporting issues. These issues may vary by disease. Readers should also be aware that HIV and AIDS data are presented differently than in previous years. Some HIV and AIDS data are presented by date of diagnosis rather than date of report. Please see the individual surveillance disease notes below for more information.

About the authors

North Carolina law requires that diagnoses of certain communicable diseases, including sexually transmitted diseases (STDs), be reported to local health departments that in turn report the information to the state. The Communicable Disease Surveillance Unit (CDSU) is the designated recipient for STD morbidity reports at the state level and is responsible for aggregating these reports and providing statewide information about these diseases to others, including the Centers for Disease Control and Prevention (CDC) in Atlanta, Georgia. The CDSU is part of the Communicable Disease Branch within the North Carolina Division of Public Health.

About the content of this report

This document, the *North Carolina 2008 HIV/STD Surveillance Report*, includes summary tables of surveillance reports and other information for syphilis, gonorrhea, Chlamydia, HIV disease, and AIDS. In some instances, total numbers of reports may not agree between separate cross-tabulations due to missing values for some variables.

Rates are presented for several categories of race/ethnicity, age groups and gender for each disease. Rates are also presented for counties and regions across the state. Rates are expressed as cases per 100,000 population. Rate denominators were calculated using the bridged race population estimates from the National Center for Health Statistics that were available at publication. Because bridged race population estimates were unavailable for 2008, 2007 estimates were used as denominators in rate calculation for 2008. Thus, the 2008 rates should be considered *preliminary* rates. More information about bridged race categories is available at the website,

<http://www.cdc.gov/nchs/about/major/dvs/popbridge/popbridge.htm>.

Rates that are based on small numbers of cases (generally fewer than 20) should be viewed with caution and are considered unreliable because these rates have large standard errors and confidence intervals that can be wider than the rates themselves. For a more complete discussion of rates based on small numbers, please see the North Carolina Center for Health Statistics' publication, Statistical

Primer No.12 “Problems with Rates Based on Small Numbers” by Paul Buescher. This publication is available at the website, <http://www.schs.state.nc.us/SCHS/>.

AIDS and HIV disease surveillance data

HIV disease case reports represent persons who have a confirmed diagnosis with human immunodeficiency virus (HIV). This category represents all new diagnoses with HIV regardless of the stage of the disease. Cases are counted by the date of diagnosis or by the date of report for the initial diagnosis. **AIDS** (acquired immunodeficiency syndrome) **case reports**, by contrast, represent only persons with HIV infection who have progressed to this later, more life threatening, stage of disease. AIDS cases are counted by the date of AIDS diagnosis or the date of AIDS report. Most AIDS case reports represent persons who were diagnosed with HIV infection in earlier years. In North Carolina, about one-fourth to one-third of the new HIV disease reports represent persons who are diagnosed with HIV infection and AIDS at the same time (concurrent). This group of concurrent diagnoses can represent up to half of our AIDS reports for the same year. Therefore, HIV disease reports and AIDS case reports should be considered separately. The two categories should never be combined to estimate an infected population, as the broad category of HIV disease includes AIDS cases that are counted by the initial diagnosis of HIV infection.

Notice of changes in this report

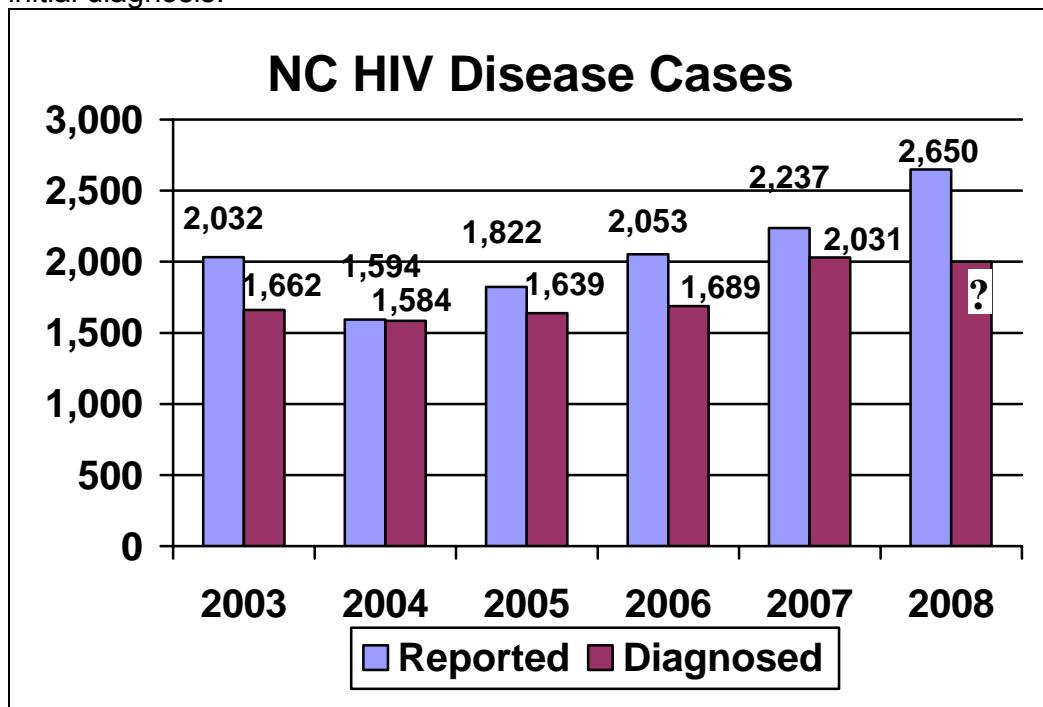

- **HIV disease cases diagnosed in prisons are not included in county totals.**

Geographically, cases are counted by the county of residence for the patient at diagnosis. Patients who are residents of a long-term facility such as prisons or other institutions are counted by the address of the facility. This causes the case counts for counties with large institutions to be higher than otherwise expected. People with HIV disease in the prisons play different roles in the epidemic of HIV/AIDS from other residents in the county. In this annual report, person diagnosed in long-term prison setting are excluded from county case totals and rates. These cases are, however, included in state totals.

- **Year of report versus year of diagnosis**

HIV disease is unlike most communicable diseases in that it is chronic in nature. Failure of providers to initially report cases and change in residence after initial diagnosis can complicate case counting. Therefore enhanced surveillance activities may artificially fluctuate the number of case reports counted by date of report. Tables 3, 5 - 7, and tables 12-17 now display cases by date of diagnosis rather than date of report. Counting cases by the date of initial diagnosis improves the analysis of the epidemic. This can be illustrated by the graph below. This graph displays case reports counted by the date of first report to the local health department (and state) compared to the date of initial diagnosis.

Note the fluctuations in report totals when counted by date of report. This has occurred because of enhanced surveillance activities. In 2003 and 2006, active follow up with providers of laboratory reports received at the central state office yielded several prevalent cases being reported that had not been reported at initial diagnosis.

Also in 2008, through a special collaborative project with one of our larger infectious disease clinics, we identified several prevalent cases of HIV and AIDS that had not been reported to the local health departments and the state. These cases were added to the surveillance system in late 2008. These cases generally represented older diagnoses, some dating back many years. Thus the report totals for HIV and AIDS in 2008 do not necessarily represent estimates of new diagnoses. Without these newly added prevalent cases, disease totals would be similar to those noted in recent years. Following cases by date of diagnosis gives a much better picture of the true increases in new diagnoses.

Tabulating case totals by date of diagnosis does delay the reporting of disease information. It takes at least six months from diagnosis for most cases reports to be verified and fully recorded in surveillance databases. Therefore, tables in this report by date of diagnosis only include cases diagnosed through 2007. As 2008 data is available it will be published in other reports.

In this annual report, the year of HIV disease diagnosis will be used in tables 3, 5 to 7, and tables 12-17. Because the complete diagnosis information usually takes 6 month to enter surveillance system, the HIV disease and AIDS diagnosed in 2008 was not listed in this annual report. In order to give readers the most recent

information, we continue displaying some tables based on the year of case report including tables 1, 2 and 4. The county rankings for HIV disease (Table 3) and AIDS cases (Table 5) are based on three-year average rates. Averaging rates helps improve the reliability of rates for counties with small numbers of annual cases.

Chlamydia surveillance data

Chlamydia case reports represent persons who have a laboratory-confirmed Chlamydial infection. It is important to note that Chlamydial infection is often asymptomatic in both males and females, and most cases are detected through screening. Changes in the number of reported cases may be due to changes in screening practices. The disease can cause serious complications in females, and a number of screening programs are in place to detect infection in young women. There are no comparable screening programs for young men. For this reason, Chlamydia case reports are always highly biased with respect to gender. The North Carolina STD Surveillance data system has undergone extensive changes in 2008 as North Carolina implements North Carolina Electronic Disease Surveillance System (NC EDSS). During this transition, Chlamydia morbidity counts for some counties may have been affected. Report totals for 2008 should be considered with this in mind. Reports are summarized by the date received in the Communicable Disease Surveillance Unit office rather than by date of diagnosis.

Gonorrhea surveillance data

Gonorrhea case reports represent persons who have a laboratory-confirmed gonorrhea infection. Gonorrhea is often symptomatic in males and slightly less so in females. Many cases are detected when patients seek medical care. Others are detected through screening but to a far lesser degree than Chlamydia cases. Gonorrhea can cause serious complications for females and a number of screening programs exist targeting this population. There is less screening of males but since they are more likely to have symptoms that would bring them to the STD clinic, gender bias in gonorrhea reporting is not likely to be large. Public clinics and health departments may do a better job of conducting such screening programs and reporting cases, causing the reported cases to be biased toward those attending public clinics. During the transition to NC EDSS, Gonorrhea morbidity counts for some counties may have been affected. Report totals for 2008 should be considered with this in mind. Reports are summarized by the date received in the Communicable Disease Surveillance Unit office rather than by date of diagnosis.

Syphilis surveillance data

Syphilis cases are reported by stage of infection, which is determined through a combination of laboratory testing and patient interviews. Primary and secondary syphilis have very specific symptoms associated with them, so misclassification of these stages is highly unlikely. Early latent syphilis is asymptomatic but can be staged with confirmation that the infection is less than a year old. Together these

three stages that occur within the first year of infection are called 'early syphilis'. This report includes only early syphilis cases, though other later stages are reported to Communicable Disease Surveillance Unit. Because North Carolina performs patient interviews, partner notification, and contact tracing on all early syphilis cases, the quality of the early latent case data is also quite good. Screening programs are more likely to detect asymptomatic cases, which may introduce some bias in the early latent case reports toward screened populations (pregnant women, jail inmates, others). However, thorough contact tracing further aids in case detection and reduces these biases. Reports are summarized by the date received in the Communicable Disease Surveillance Unit office rather than by date of diagnosis.

For more information

For a more detailed discussion of the content, strengths, and weaknesses of STD and HIV surveillance data, please see Appendix B of the most recent *HIV/STD Prevention & Community Planning Epidemiologic Profile for North Carolina*. Recent trend information can also be found on the fact sheets available at the web site, <http://www.epi.state.nc.us/epi/hiv/surveillance.html>.

Highlights

- As of December 31, 2008, the estimated number of living HIV/AIDS cases reported in NC was 23,356 (Table 1)
- As of December 31, 2008, the cumulative number of HIV disease cases reported in NC was 35,346 (Table 2).
- As of December 31, 2008, the cumulative number of AIDS cases reported in NC was 17,995 (Table 3).
- The three-year (2005-2007) average rate of diagnosed HIV disease in NC was 20.1 per 100,000 population. The top five counties with highest rates were Mecklenburg (41.8 per 100,000), Edgecombe (40.2 per 100,000), Durham (34.7 per 100,000), Washington (33.3 per 100,000) and Lenoir County (33.3 per 100,000) (Table 4).
- Among the HIV disease cases diagnosed in 2007, African Americans represented 62% of all cases with a rate of 79.5 per 100,000 adult/adolescent population. The highest rate (113.6 per 100,000) was among adult/adolescent African American males (Table 12).
- The reported number of early syphilis cases in NC in 2008 was 509, with a rate of 5.6 per 100,000 population (Table 11).
- The top five counties reporting most early syphilis cases in 2008 are Mecklenburg (91), Guilford (50), Forsyth (46), Durham (39), and Wake County (37) (Table 11).
- African American males represented 55% of total early syphilis cases (Table 24).
- The reported number of gonorrhea cases in 2008 was 14,866 (Table 9).
- In 2008, African American males and females had highest gonorrhea rates (490.1 and 473.4 per 100,000 respectively), and represented 30% and 33% of total cases. American Indian females ranked the third with rate of 351.2 per 100,000 population (Table 20).
- The reported number of Chlamydia cases in 2008 was 37,555. (Table 8).
- In 2008 among female Chlamydia reports, the age groups with highest rates was 20-24 year olds (4,040.6 per 100,000) followed by 15-19 year olds (3,968.6 per 100,000) (Table 19).
